

8. Write a program to create strings and display the conversion of string to StringBuffer and StringBuilder.

```
public class StringConversionExample {  
    public static void main(String[] args) {  
        // create a string  
        String str = "GOOD MORNING!";  
  
        // convert to StringBuffer  
        StringBuffer stringBuffer = new StringBuffer(str);  
  
        // convert to StringBuilder  
        StringBuilder stringBuilder = new StringBuilder(str);  
  
        // display the original string, StringBuffer, and StringBuilder  
        System.out.println("Original string: " + str);  
        System.out.println("StringBuffer: " + stringBuffer);  
        System.out.println("StringBuilder: " + stringBuilder);  
    }  
}
```

OUTPUT:

Original string: GOOD MORNING!

StringBuffer: GOOD MORNING!

StringBuilder: GOOD MORNING!
